    No. is the number of results predicted by chance to have a
re greater than or equal to the score of the result being printed,
is derived by analysis of the total score distribution.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                             A_Geneseq_032802:*

Its amino acid sequence was deduced from a cDNA clone (AAT72800) obtd. from activated T-cell library. The protein shows 39.31% identity and 58.405% similarity to human interleukin-8 receptor. Recombinant HSATU68 can be expressed in prokaryotic or eukaryotic host cells and used to raise antibodies or to screen for agonists or

Additionally, N may be used to produce the colon cancer-associated Ps, by inserting the nucleic acids into an host cell and culturing the cell to express the proteins. N and P can be used in the prevention, diagnosis and treatment of colorectal carcinomas and cancers. AAH37196 to AAH37204 and AAB77789 represent sequences used in the exemplification of the
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  AAH32943 to AAH37195 and AAG73514 to AAG77788 represent human colon cancer associated nucleic acid molecules (N) and proteins (P), where the proteins are collectively known as colon cancer antigens. The colon cancer antigens have cytostatic activity and can be used in gene therapy and vaccine production. N and P may be used in the prevention, diagnosis and treatment of diseases associated with inappropriate P expression. For example, N and P may be used to treat disorders associated with decreased expression by rectifying mutations or deletions in a patient's genome that affect the activity of P by expressing
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            Nucleic

                                                                                                                                                                                                                        CC This sequence represents human chemokine receptor CXCR3b, a splice CC variant of chemokine receptor CXCR3 (also referred to as CXCR3a). CC Chemokines are a family of small cytokines which bring about the CC chemokines are a family of small cytokines which bring about the CC chemokines are a family of small cytokines which bring about the CC chemokines are less selective. CC all chemokine receptors are seven transmembrane G-protein coupled creceptors and most are receptors for a number of chemokines, CXCR3a being a receptor for the CXC chemokines IP10 and Mig. CXCR3a is CC expressed in activated, but not in resting T-lymphocytes, and may CX cherefore play an important role in the selective recruitment of CX creats which occurs in T-cell mediated inflammatory conditions. CC CXCR3b may have an altered pattern of tissue distribution and CX function in the inflammatory process. Cells expressing the active CXCR3b are useful for identifying ligands, especially agonists and CX antagonists, of a chemokine receptor. In addition, the receptor CXCR3b are useful for interaction with CXCR3b. The modulation CX inflammatory responses is of therapeutic benefit in many conditions CX such as rheumatoid arthritis, psoriasis, multiple sclerosis, atherosclerosis and CX and restranosis.

Inhibitors and promoters of mammalian CXCR3 can be detected and identified using host cells expressing CXCR3. CXCR3 inhibitors can be used for treatment of inflammatory diseases which are T cell mediated. CXCR3 promoters are useful for antitumour or

                                                                                                                                                                                                                                                                                                                                                                                                                                                                               B
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   δÃ
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           CC of endogenous human orphan (a protesh) coupled receptors (GPCRS, ANY90643-Y90687), and to DNA encoding them (AAA30709-A30743 CC AAY90677) and AAY90683-Y90687), and to DNA encoding them (AAA30709-A30743 CC and AAA30775-A30779). The mutant proteins of the invention contain a CC mutation in a portion of the protein comprising intracellular loop 3 CC (IC3) and transmembrane domain 6 (TM6). A non-endogenous amino acid, X, CC is substituted for an endogenous residue in IC3 at a position 16 amino CC acids N-terminal of an endogenous proline in TM6 to form a sequence CC X-(AA)15-Pro. The endogenous amino acid is selected from Lys, His, Arg CC or Ala, and is preferably Lys. When the endogenous residue at this CC position is Lys, this residue is replaced by His, Arg or preferably Ala. CC The 15 amino acid stretch between the substituted amino acid and the Pro CC may be endogenous, non-endogenous, or a mixture of endogenous and CC mon-endogenous residues. The constitutively active GPCRs are useful for CC identifying antagonists, agonists and partial agonists for use as CC pharmaceutical agents. The mutant proteins are also useful in research constitutions. Antagonists for a particular GPCR are useful for treating diseases and disorders associated with that receptor. Because CC the novel mutant GPCRs are constitutively active, they can be used CC treatily for screening of compounds without the need for endogenous CC ligands. The present sequence represents a human wild-type GPCR referred to in an exemplification of the invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            Matches

                                                                                                                                                                                                                                                                                                  inflammation), or autolimnue diseases (rheumatold arthritis or lupus), where the (cardio)vascular, lymphatic, respiratory, nervous, digestive, endocrine, motor or urogenital systems or skin are affected, and bone marrow diseases. The products of the invention are chemokine derivatives which have cytostatic, antiinflammatory, antiasthmatic, intiarthritic. Immunosuppressive, dermatological, antirheumatic, antiarthritic. Chemokines act on specific tumor and inflammatory cells through a constellation of chemokine receptors (CR), which control migration and proliferation of these cells. AAG80045-AAG80128 represent human chemokine fragments used to illustrate the method of the invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                           This invention describes a novel diagnostic agent (A) comprising at least two different ligands (I) for receptors (II) that are implicated in disease. (A) are used for the diagnosis of tumors (especially colorectal or prostatic), organ rejection, inflammation and autoimmune diseases. Also inhibitors of (I) are used therapeutically against tumors (and their metastases), inflammation (particularly bronchial asthma or chronic bowel inflammation).
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         WPI;

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  밁
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          멍
CC AAY90677 and AAY90683-Y90687), and to DNA encoding them (AAA30709-A30743 CC and AAA30775-A30779). The mutant proteins of the invention contain a mutantion in a portion of the protein comprising intracellular loop 3 CC (IC3) and transmembrane domain 6 (TM6). A non-endogenous amino acid, x, CC is substituted for an endogenous residue in IC3 at a position 16 amino CC acids N-terminal of an endogenous proline in TM6 to form a sequence CC x-(AA)15-Pro. The endogenous amino acid is selected from Lys, His, Arg CC or Ala, and is preferably Lys. When the endogenous residue at this position is Lys, this residue is replaced by His, Arg or preferably Ala. CC The 15 amino acid stretch between the substituted amino acid and the Pro may be endogenous, non-endogenous, or a mixture of endogenous and con-endogenous residues. The constitutively active GPCRs are useful for identifying antagonists, agonists and partial agonists for use as C pharmaceutical agents. The mutant proteins are also useful in research settings for elucidating the roles of the receptors in normal and cc diseased conditions. Antagonists for a particular GPCR are useful for
                                                                                                                                                                                                                                                                                         The invention relates to constitutively active, non-endogenous versions of endogenous human orphan G protein-coupled receptors (GPCRs, AAY90643-AAY90677 and AAY90683-Y90687), and to DNA encoding them (AAA30709-A30743
                                                                                                                                                                                                                                                                                                                                                                                                      agents
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            G protein-coupled receptor; GPCR; constitutively active; intracellular loop 3; transmembrane domain 6; drug scree
                                                                                                                                                                                                                                                                                                                                                                     Example

CC therapeutically to treat conditions associated with abhormal physiology
CC or development e.g. inflammatory conditions such as asthma. Chemokines
CC are important in immune and inflammatory responses in that they induce
CC leukocyte migration and adhesion. They are also chemoattractants for
CC several cells involved in inflammation and can induce other biological
CC responses e.g. modulation of second messenger levels (e.g. Ca++),
CC cellular morphology modification responses, phosphinositide lipid
CC turnover, possible antiviral responses etc. The chemokine receptors of
CC the invention exhibit structural properties of G-protein coupled
CC receptors (GPCR), although their ligands have not yet been identified.
CC ligand: receptor complexes in vivo or in assay techniques. Assays may
CC also involve chemical antagonists which block complex production or
CC (especially neurons, macrophages or lymphocytes) to treat e.g. abnormal
CC (especially neurons, macrophages or lymphocytes) to treat e.g. abnormal
CC (especially neurons, macrophages or lymphocytes) to treat e.g. abnormal
CC are also used to produce antibodies useful diagnostically, for drug
CC screening or for polypeptide purification. The polypeptides are useful
CC polypeptides or related sequences, especially from other species. They
CC also allow transformation of cells for polypeptides. The
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 This represents a rodent chemokine receptor HST01.1 amino acid sequence. The invention provides novel primate and rodent chemokines and chemokine receptors. The chemokines, receptors and binding compounds (optionally antibodies/fragments specifically binding the chemokines) are useful
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                Rodent and primate chemokines and chemokine receptors - useful diagnostically and therapeutically to treat conditions associated with abnormal physiology or development e.g. inflammatory conditions \frac{1}{2} \left( \frac{1}{2} \right) \left( \frac
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                Claim

                                                                                                                                                                                                                                                                                                                                                                                                                     (BLC, see AAY06641). The methods comprise combining BLR1 and BLC polypeptides with a candidate modulator agent under conditions whereby, but for the presence of the agent, the polypeptides engage in a first interaction, and determining a second interaction of the polypeptides in the presence of the agent, wherein a difference between the first and second interactions indicates that the agent modulates the interaction of the polypeptides. The modulator is preferably an antagonist, especially dominant negative, form of BLC. BLC and BLC agonists and antagonists may be useful for treating viral (e.g. HIV) infections, lymphoma, B lineage

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      Вb
                                                             CC polymerase chain reaction (PCR) primers, oligomers, and for chromosome CC and gene mapping, and in recombinant production of (II). The CC polynucleotides are also used in diagnostics as expressed sequence tags CC for identifying expressed genes. (I) is useful in gene therapy techniques (II). (II) is useful for generating antibodies against it, detecting or CC (II). (II) is useful for generating antibodies against it, detecting or CC quantitating a polypeptide in tissue, as molecular weight markers and as a food supplement. (II) and its binding partners are useful in medical climaging of sites expressing (II). (I) and (II) are useful for treating CC imaging of sites expressing (II). (I) and (II) are useful for treating CC disorders involving aberrant protein expression or biological activity. The polypeptide and polynucleotide sequences have applications in CC diagnostics, forensics, gene mapping, identification of mutations cresponsible for genetic disorders or other traits to assess biodiversity and to produce other types of data and products dependent on DNA and CC amino acid sequences. ABG00010-ABG30377 represent novel human CC specification, but was obtained in electronic format directly from WIPO case of the content of the printed content of the content of the printed content of the content of the content of the printed content of the conten

treating or ameliorating a medical condition in a mammalian subject \ensuremath{\text{e.g.}} arthritis and cancer -
                                                                                                        English
```

Componential therapeutic applications. The polypeptides of the invention may differentiation activities, including cytokine, cell proliferation or cell differentiation activities; stem cell growth factor activity; cell immunomodulatory activities; stem cell growth factor activity; cell immunomodulatory activity; activin- or inhibin-related activities; chaematopoiesis regulatory activity; tissue growth activities; cor chamotractic or chemokinetic activities; haematotatic, thrombotic or thrombolytic activities; activities; haematotatic, thrombotic or chemokinetic activities; provides and nucleotides of the invention are useful for preventing, treating or ameliorating medical conditions, e.g., by protein or gene therapy. Such conditions include cancers, haematopoietic disorders (e.g., myeloid or lymphoid cell conditions, e.g., by protein or gene therapy. Such conditions include carterial ischaemia, bone disorders (e.g., myeloid or lymphoid cell vascular growth. Polypeptides involved with tissue regeneration and carterial ischaemia, bone disorders (e.g., osteoporosis), and abnormal carterial ischaemia or uncisions and ulcers), while those with carterial ischaemia or viral, communicativities may be used to promote with the can be used to use invention also relates to vectors and recombinant host cells comprising a nucleotide of the invention, methods of producing the novel polypeptides, antibodies against the polypeptides, methods of detecting the nucleotides or polypeptides in a sample, and methods of identifying compounds which bind to polypeptides of the invention. Honough novel, many of the polypeptides of the invention have homology to known proteins, thereby giving an insight into their probable biological activities, and hence polypeptide Sequences ABB10981-ABB12330 techniques. The present sequence represents a novel human ABA08225-ABA09574 of the invention represent 1350 novel human polypeptides, and are acids encoding them. The and

                                                                                                                                                                                                                                                                       The II-8 receptor cDNA sequence was isolated (see AAQ29505) and a 874bp sub-fragment of the coding sequence was used as a probe to screen human cell line HL60 and human peripheral blood lymphocyte cDNA libraries. Two new gene sequences were found that are clearly related to the II-8 receptor. One of these was contained in clone 8rr.9 and 1s predicted to encode an amino acid sequence which is 56% and 38% identical with the high and low affinity II-8 receptor sequences, respectively. See also AAQ37107.

                                                                    to treat or prevent inflammation e.g. psoriasis, dermatitis, rheumatoid arthritis and particularly inflammatory bowel disease and chronic lung inflammation. When immobilised, these antibodies may be used to detect interleukin-8 receptor B expression in cells and tissues and for affinity purification of interleukin-8 receptor B from cells. This sequence is an additional chemokine superfamily receptor which was identified by probing lamda libraries of genomic DNA from a human monocyte-like cell line (L-60) and human peripheral blood lymphocytes using a large fragment of the interleukin-8 type A receptor DNA (See AAQ99006).
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               Interleukin; IL-8; inflammation; psoriasis; dermatitis;

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         Q
         This sequence represents human Burkitt's lymphoma receptor 1 (BLR1). The invention relates to methods for modulating the interaction of BLR1 with its ligand, B lymphocyte chemoattractant (BLC, see AAY06642). The methods comprise combining BLR1 and BLC polypeptides with a candidate modulator agent under conditions whereby, but for the presence of the agent, the polypeptides engage in a first interaction, and determining a second interaction of the polypeptides in the presence of the agent, wherein a difference between the first and second interactions indicates that the agent modulates the interaction of the polypeptides. The modulator is preferably an anasonist, especially dominant negative, form of
                                                                                                                                                                                                                                                                                                           Cyster
                                                                                                                                                                                                                  Modulating interaction of a Burkitt's Lymphoma Receptor polypeptide and ligand, useful in drug screens
                                                                                                                                                                                                                                                                               WPI; 1999-493764/41.

Proc. Natl. Acad. Sci. U.S.A. 95:8205-8210(1998).
-i- FUNCTION: RECEPTOR FOR SCYB9/MIG, SCYB10/INP10 AND SCYB11/ITAC SIMILARITY). BINDS TO SCYA21.
-i- SUBCELLULAR LOCATION: Integral membrane protein.
-i- SIMILARITY: BELONGS TO FAMILY 1 OF G-PROTEIN COUPLED RECEPTORS.
